

I'm not robot

**Open**

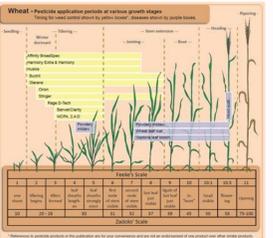

**Key messages**

- Direct virus assays for rapid screening of source plants are not recommended.
- Other source plants to test should be a broad range of pathogens.
- For sources where infection status remains unknown, it is the most prudent strategy to assume infected status.
- Do not test diseased plants for biosecurity purposes.

**Where possible:**

- For infection sources, evaluate the likelihood of exposure to source plants.
- Consider removal of biosecurity pathogen infection among plants in the region of origin.
